CureComp

COMPANY PROFILE
EDITION 2026

CURECOMP TECHNOLOGY · SEREMBAN, MALAYSIA

From a single PC to a whole network. We build it, run it, and keep it alive.

01 SHOP & REPAIR

02 MANAGED IT

03 NETWORKING & WI-FI

04 CLOUD & DATA CENTRE

05 FIBRE & PON

WHO WE ARE

A computer shop that grew into infrastructure.

CureComp Technology started where most IT businesses do — fixing machines and selling parts in Seremban. The difference is where it went next: managed networks for ministries and manufacturers, a data centre, and Malaysia's first third-party GPON ONT.

What we do, in plain terms

We sell and service computers, parts and supplies. That's the counter you can walk up to at Seremban Plaza.

Behind it, we operate as a **Managed Service Provider** — supplying computers, laptops, tablets and mobiles, and designing and running networks: PON/GPON, Layer 2 and Layer 3, firewalls, site-to-site VPN and Wi-Fi, with 24/7 live support.

We supply and install **networking and Wi-Fi** across the whole range, from a home router to ISP-grade equipment, with every roaming access point hardwired back to the switch.

We run cloud and connectivity as a **data centre operator, digital infrastructure provider and telecom service provider** — dedicated servers, colocation, VM/LXC and IPv6 allocation.

And we are the **official supplier and reseller of the Anime4000 GPON Stick** and NIJIKA Firmware SDK — the work that put Malaysia's first third-party ONT into customers' hands.

Very few companies cover all of this. That is exactly why nothing gets lost between the hardware vendor, the network team and the host — they're the same people.

HOW WE GOT HERE

Five practices, grown one deployment at a time

Each practice was added because clients needed it — and because owning the next layer of the stack meant one less hand-off where things go wrong.

OUR PROMISE

One partner, accountable end to end.

Plenty of vendors sell you a box and disappear. We stay on the line — because the same team that specified your hardware also runs your network and hosts your servers.

OUR MOTTO

Quality is our priority.

THE DIFFERENCE

One accountable partner

No finger-pointing between the hardware vendor, the ISP and the host.

Visibility by default

You get the monitoring, the dashboards and the numbers behind your SLA.

Standards, not lock-in

Layer 2/3 done properly, open firmware where it makes sense, documented handover.

Local and reachable

Seremban-based, on-site across Negeri Sembilan and the Klang Valley.

CONTINUITY

Business continuity first

Backups, redundant links, spare-unit swaps and documented recovery steps — designed before the outage, not during it.

RESPONSE

Response you can plan around

Agreed response targets written into your service agreement, with 24/7 live support on covered contracts.

SCALE

Room to grow

Start with five desks and one switch. Scale to multi-site VPN, colocation and a burstable 10 Gbps uplink without re-architecting.

CAPABILITIES

Everything between the wall socket and the data centre

Buy a machine, hand us the whole network, wire and cover the building, park your servers with us, or take control of your own fibre. Most clients end up doing more than one.

01

Shop & repair

Computers, laptops, parts, peripherals and supplies — plus diagnostics, upgrades, data recovery and on-site repair for walk-in customers and businesses alike.

- Custom PC builds
- New & refurbished laptops
- Data recovery
- On-site service

02

Managed IT

We become your IT department: devices, networking, firewalls, site-to-site VPN, Wi-Fi and monitoring, with 24/7 live support under one agreement.

- Device lifecycle
- Firewall & VPN
- Backup & DR
- 24/7 support

03

Networking & Wi-Fi

Home to ISP-grade gear, Layer 2 and Layer 3 switching, structured cabling and hardwired Wi-Fi 6 and Wi-Fi 7 roaming networks designed to hold up under load.

- Wi-Fi 6 · 6E · 7
- 10G to the desk
- FTTR
- fq_codel QoS
- MikroTik

04

Cloud & data centre

Dedicated servers, colocation and VM/LXC hosted on Perfect (AS154516) — 1 Gbps as standard, burstable to 10 Gbps, with native IPv6 from our own allocation.

- Bare metal
- Colocation
- KVM / LXC
- IPv6 up to /48

05

Fibre & PON

Official supplier and reseller of the Anime4000 GPON Stick and NIJIKA Firmware SDK — Malaysia's first third-party ONT. Own your fibre link and monitor it yourself.

- TM Unifi
- Maxis
- TIME
- PERFECT
- White label

ALSO AT THE COUNTER

Everyday tech, done properly

- Custom PC — gaming & office
- PC & laptop sales and service
- CCTV & surveillance systems
- Server maintenance
- Linux expertise
- Firewall & security
- MikroTik supply & configuration
- Printers & supplies

WHO WE SERVE

Government & public sector

Ministries, councils and agencies, with accountable support.

Manufacturing & industry

Plant-floor networks and resilient office-to-production links.

Healthcare & clinics

Reliable systems for patient records and practice software.

Education & training

Lab rollouts, device fleets and Wi-Fi for a full classroom.

Hospitality & retail

Guest Wi-Fi, POS uptime and multi-outlet VPN.

ISPs & integrators

PON Stick supply, NIJIKA firmware and edge colocation.

SHOP & SERVICE CENTRE

The right machine, the right part, fixed properly

We supply computers, components, peripherals and consumables across all major brands — and we service what we sell. Tell us the job; we'll spec it, source it, build it and support it.

Desktops & workstations
Office, gaming and CAD/video builds, burn-in tested.

Laptops, tablets & mobiles
Single units or fleets, new and refurbished.

Components & servers
CPUs, GPUs, memory, storage — up to ECC, ZFS and IPMI.

Peripherals & displays
Monitors, docks, UPS units, headsets and cabling.

Printers & supplies
Printers, scanners, toner, ink, ribbons and paper.

Networking gear
Routers, switches, APs, SFP modules and the PON Stick.

How a repair runs

Diagnose first. Quote second. Fix once.

01 **Drop off or call out**
Seremban Plaza or an on-site visit

02 **Diagnosis**
Test, find the fault, check parts stock

03 **Written quote**
You approve cost and turnaround first

04 **Repair & test**
Stress-tested, cleaned, data verified intact

05 **Handover**
With a note of parts and work warranty

MANAGED SERVICE PROVIDER

Your IT department, without the headcount

We supply the devices, design and run the network, secure the perimeter, and answer the phone at 3 a.m. One contract covers the lot.

01 Device supply & lifecycle
Procured, imaged, asset-tagged, patched and retired securely.

02 PON / GPON connectivity
Fibre designed, provisioned and monitored — including the PON Stick.

03 Layer 2 & Layer 3
Cabling, managed switching, VLANs, routing and inter-site links.

04 Firewall & perimeter
NGFW, policy design, IDS/IPS and rule reviews that don't rot.

05 Site-to-site & remote VPN
Encrypted tunnels between branches, plus sane remote access.

06 Wi-Fi design
Survey, AP placement, channel planning, roaming and SSID separation.

07 Monitoring & alerting
Links, switches, servers and APs watched continuously from our NOC.

08 Backup & disaster recovery
On- and off-site backups, tested restores, a written recovery plan.

09 24/7 live support
Engineers at any hour on covered contracts — remote first, on-site when needed.

Taking over an existing network? We've done it before.

STEP 1
Discovery & audit
Inventory of devices, links, licences and access — where the risk sits.

STEP 2
Remediation plan
Urgent, project or can-wait — prioritised and costed, so you choose.

STEP 3
Transition
Credentials secured, monitoring deployed, backups verified, escalation agreed.

STEP 4
Steady state
Patching, reporting and service reviews — documentation kept current.

HOME · ENTERPRISE · ISP-GRADE

Networking that behaves like infrastructure, not a gadget

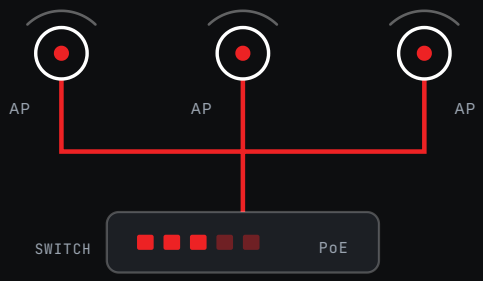

From one router to a whole exchange — fast when it's busy, which is the only time it matters. Every design is surveyed, cabled, tuned and documented.

OUR RULE

Hardwired, always.

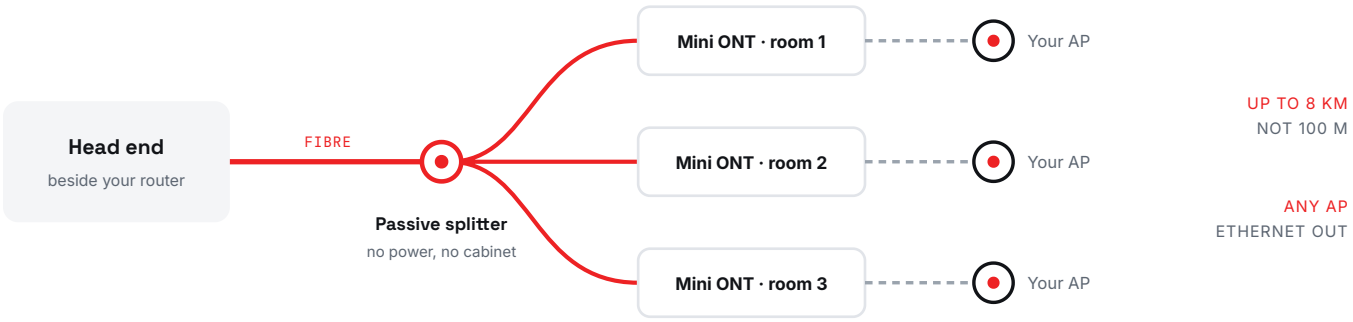

Every roaming access point is cabled back to the switch — copper with PoE in the building, fibre between blocks. No wireless mesh: each hop halves throughput, latency stacks up, and one weak link degrades everything behind it.

One SSID · 802.11k / v / r roaming · PoE from the rack · Controller you own

FTTR — fibre to the room

When the building won't take Cat6, run fibre instead.

A splitter that behaves like a switch — with no power. Cheaper than a dedicated link per room, mesh-like coverage that is actually wired, and no vendor lock on the access points.

Wi-Fi generations we design for

Wi-Fi 6 802.11ax
The repair generation: OFDMA, MU-MIMO, BSS Colouring, Target Wake Time and WPA3.

Wi-Fi 6E 6 GHz
The same PHY on clean 6 GHz spectrum — wide channels without legacy clients.

Wi-Fi 7 802.11be
MLO, 320 MHz channels, 4096-QAM and Multi-RU — lower jitter under load.

Wi-Fi 8 802.11bn
Ultra High Reliability. Tracking the draft; ratification projected for 2028.

Switching & routing	Managed Layer 2 and Layer 3, VLAN, LACP, PoE / PoE+; carrier routing and switching
Queue management	fq_codel, per-device fair queuing, application priority — low latency even under a full download
Desktop links	1G, 2.5G and 10G, copper or fibre to the desk (SFP+ card, fibre run, SFP+ switch)
Site-to-site	Encrypted Layer 2 bridge and Layer 3 VPN; multi-site failover
Storage	NAS with RAID or ZFS, snapshots and off-site backup — private storage in your building
ISP-grade & operators	OLT and PON equipment, optics (SFP, SFP+, DAC, SM/MM fibre); working relationships with major ISPs including Telekom Malaysia
NOC monitoring	Included on SME, MikroTik and Enterprise plans — nothing changes without your say-so

HOSTED ON PERFECT · AS154516

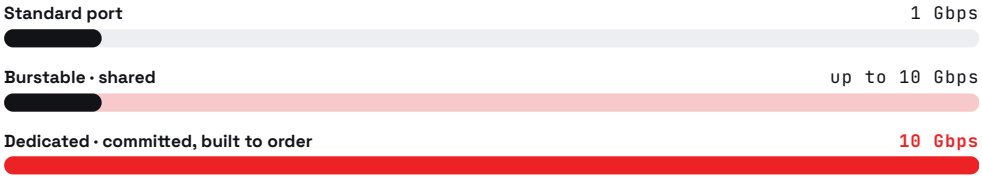

Infrastructure you can actually reach

Dedicated servers, colocation and virtual machines on a network built for throughput. Talk to the engineer who racks your box, not a ticket queue three time zones away.

Bandwidth options

Shared capacity so peaks don't force a permanent upgrade — or a full 10 Gbps committed to you alone.

01 · DEDICATED

Bare metal, all yours

No noisy neighbours — for databases, virtualisation hosts and anything latency-sensitive. Out-of-band management, OS of your choice.

02 · COLOCATION

Your hardware, our facility

Conditioned power and cooling, cross-connects, and remote hands for reboots, swaps and cabling.

03 · VM / LXC

Virtual, spun up fast

KVM or LXC for staging, services and CI runners. Scale CPU, memory and storage; snapshots and private networking.

04 · IPV6

Native, up to a /48

Real IPv6 from our own space — plenty of /64s for VLANs and VMs, dual-stack, reverse DNS on request.

Data centre operator

Power, cooling, physical security and hands-on remote support.

Digital infrastructure

Compute, storage and networking your application can just run on.

Telecom service provider

Transit, IP allocation and the PON expertise most hosts don't have.

GOOD FITS

What people run with us

- AI training & inference
- Payment & critical services
- Heavy egress & mirrors
- ERP & business systems
- Web & API hosting
- Backup & DR targets
- Routers, probes & edge gear

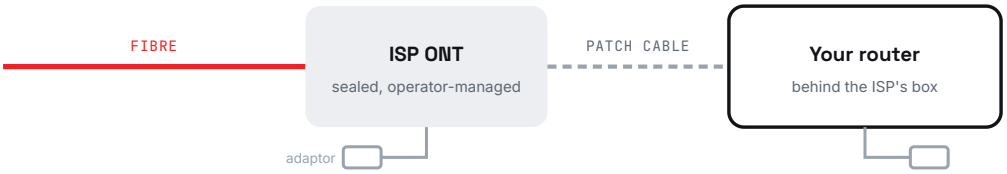

Uplink capacity is shared and burstable unless dedicated bandwidth is contracted. Addressing is issued from CureComp's allocation; customer-owned IP space and ASN announcements are not supported. All services are quoted per requirement.

MALAYSIA'S FIRST THIRD-PARTY ONT

Your fibre. Your ONT. Your visibility.

The PON Stick replaces the operator's sealed box with an SFP-form ONT that plugs straight into your own router — so you can see the light levels, read the alarms, and prove where a fault actually is.

BEFORE · OPERATOR ONT

Three devices,
two adaptors,
a black box you can't see into.

WITH THE PON STICK

One device.
Your telemetry, your spares, recovery in minutes.

Monitor it yourself

Optical Rx/Tx power, temperature, PON state, uptime and alarms — exported to Prometheus and Grafana.

Recovery in minutes

Swap in a spare stick, re-plug the fibre and you're back. No waiting for a truck roll.

Faster, lower latency

One less device, one less hop, one less NAT layer between your router and the fibre.

Clean responsibility

The ISP owns the line up to the fibre; you own the rest. Troubleshooting stops being an argument.

Less clutter, less power

An SFP module replaces a powered box, its adaptor and its patch cable.

Evidence, not blind trust

Timestamped link history to put in front of your ISP when uptime is contractual.

Supported operators

TM Unifi | Maxis | TIME | PERFECT

Product	Anime4000 GPON Stick
Firmware	NIJIKA Firmware SDK
Form factor	SFP ONT for a router's SFP cage
Routers	Wide MikroTik support; **RB5009** recommended
Supply	CureComp — official supplier & reseller

RESELLER PROGRAMME

Sell it as your own product

Networking shops, integrators and ISPs buy at supplier pricing and ship under their own name — your identity written into the module itself.

- Custom label and packaging artwork
- Vendor name, part number and serial number in the SFP EEPROM
- NIJIKA firmware updates for the life of the product
- Engineering backup your customer never sees

Member of the Open PON Foundation

Keeping fibre access open, interoperable and accountable to the people paying for it — genuine third-party ONTs, supported firmware and honest advice about what your operator does and doesn't allow.

FROM THE FIELD

Selected projects

A track record built one deployment at a time — from a two-PC clinic order to a 4,000-device Wi-Fi 7 network.

FEATURE PROJECT · PAGES 10–11

Thine Technology: thousands of phones, ~10 Gbps, one network

Four TM Unifi lines on PON Sticks and a Perfect dedicated 10G line, load-balanced on a CCR2116, with a /32 for every device and Wi-Fi 7 access points planned like cellular small cells.

4,911
DEVICES, EACH ON ITS OWN /32

ENTERPRISE OFFICE · WI-FI 7

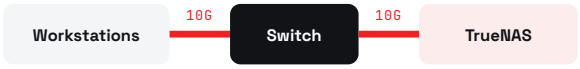

AIRR Labs Malaysia Sdn Bhd

Two ISP lines combined behind one network — Unifi 2 Gbps and TIME 1 Gbps — with Wi-Fi 7 access points, high-speed switching and a tidy rack, configured A to Z.

OFFICE LAN · STORAGE

Super Bonfire Malaysia

LAN switching upgraded to 10 Gbps, with a 10 Gbps TrueNAS storage server so the whole team works from fast, central, private storage.

PUBLIC SECTOR · NEGERI SEMBILAN

Local government & police stations

Networking work for Majlis Daerah Kuala Pilah, and IT jobs at police stations around Negeri Sembilan — alongside work for KDN, LPPKN and Galeri Diraja Tuanku Jaafar.

MDKP · PDRM stations · KDN

HEALTHCARE · SUPPLY & BUILD

Dialysis centre & clinics

Office PCs specified, assembled and delivered for YKN Dialisis Kuala Pilah, and a custom-PC project for Klinik Ammanpal in Nilai — plus on-site PC maintenance for clinics and offices.

Office PC builds · Delivery across N. Sembilan

HOSPITALITY · KELANTAN

Homestay & chalet networking

Network setup for a homestay and chalet property in Kelantan, one of several projects outside Negeri Sembilan.

Hospitality · Kelantan

INFRASTRUCTURE SUPPORT · ON-SITE

Network maintenance & preventive care

On-site inspection of server racks and network equipment, connection troubleshooting, power and UPS checks and cable management, so problems are found before they become downtime.

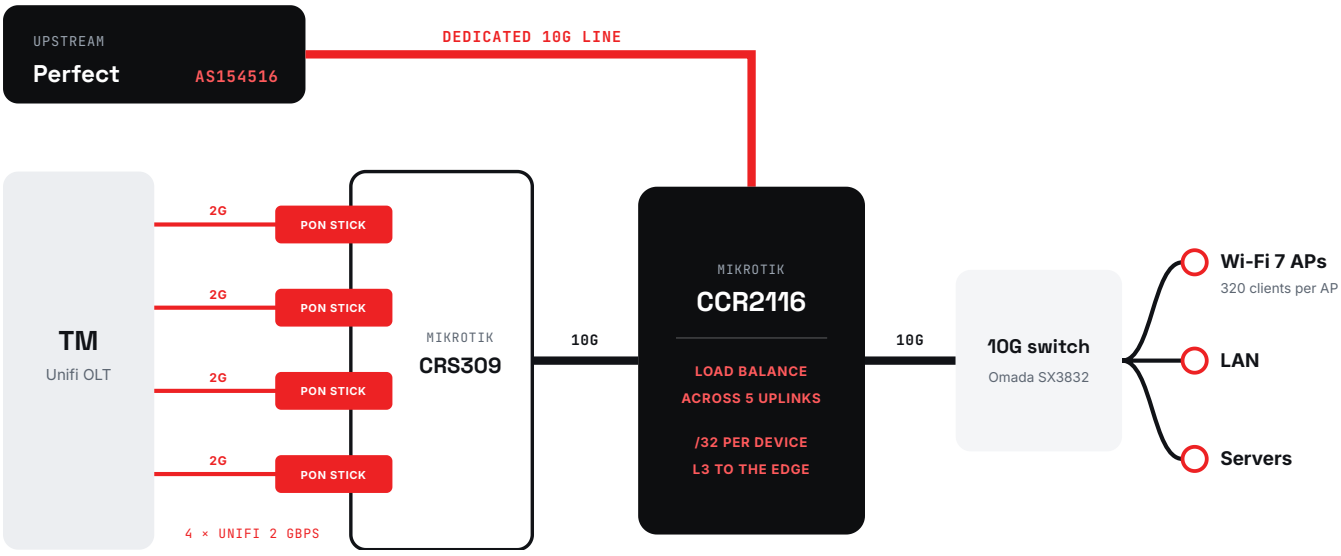

Server rack · UPS · Structured cabling

Summaries are drawn from CureComp's published project posts. Client-specific configurations remain confidential.

FEATURE PROJECT · THINE TECHNOLOGY SDN. BHD.

Thousands of phones, ~10 Gbps, one network

Thine Technology runs a remote Android phone platform: physical handsets that overseas users reach the way they would a virtual machine, except every one is a real phone. The platform is theirs. The network under it is ours, built to carry around 10 Gbps and thousands of Wi-Fi 7 clients without drowning in broadcast traffic.

UPLINKS

Five links, one gateway

Four TM Unifi 2 Gbps lines terminate on PON Sticks in a MikroTik CRS309, with no ISP boxes, and join a Perfect AS154516 dedicated 10G line on a CCR2116 that load-balances across all five.

ADDRESSING

Layer 3 to every device

Every device is leased its own /32, a subnet of one, so no two devices share a broadcast domain. At 4,000 devices, ARP and broadcast storms have nowhere to form.

WI-FI 7

Access points as small cells

APs are planned like LTE/5G cells: capacity comes from AP density, not transmit power, with BSS Colouring and OFDMA keeping hundreds of clients per AP stable.

MEASURED ON SITE

MIKROTIK INTERFACE STATS · DHCP SERVER · SPEEDTEST

7.8 Gbps
SUSTAINED DOWNLOAD ON A SINGLE 10G SFP+ PORT

768K pkt/s
WITH ZERO DROPS AND ZERO ERRORS

4,911
DHCP LEASES, EACH ONE A /32

6.5 / 5.1 G
SPEEDTEST DOWN / UP, 3 MS PING TO TM

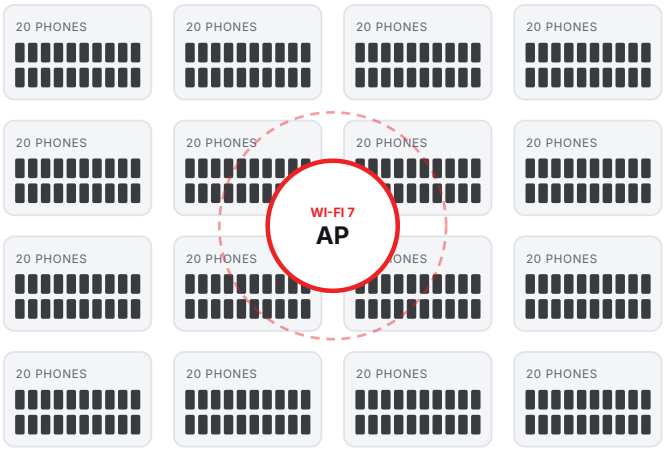

Built with

Anime4000 GPON Stick × 4 · MikroTik CRS309-1G-8S+IN · MikroTik CCR2116-12G-4S+ · TP-Link Omada SX3832 10G · Wi-Fi 7 access points · Perfect dedicated 10G

THINE TECHNOLOGY · DESIGNING FOR DENSITY

Wi-Fi that behaves like a cellular network

Thousands of phones on Wi-Fi look less like an office and more like a cell site. So the design follows a mobile operator's rules (small cells, scheduled airtime, density over power), and we test it with real handsets, not synthetic traffic.

TEST METHOD: PHONE FARMING

- Real iPhones and Android handsets as independent clients
- Continuous background traffic: idle, bursts and roaming
- Real operating-system behaviour, not synthetic traffic generators

WHY IT MATTERS

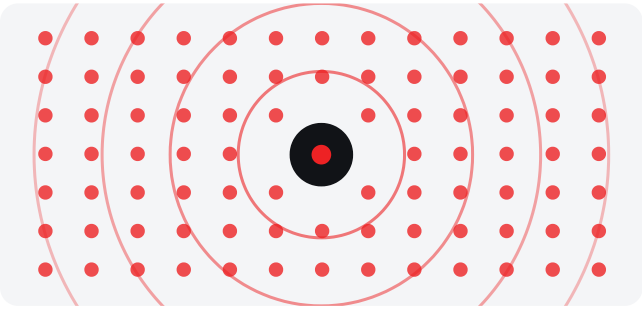

- Dense Wi-Fi now looks like cellular density
- Single-client speed tests hide contention problems
- Shows scheduling, airtime fairness and latency under load

WHAT WE OBSERVE

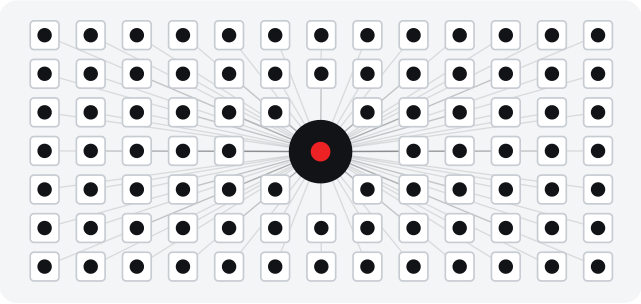

- Wi-Fi 6/7 access points behave like small cells
- BSS Colouring and OFDMA stabilise dense deployments
- Performance scales with AP density, not transmit power

Why every device gets a /32

The same devices, addressed two ways.

Flat subnet. One broadcast domain: every ARP request and broadcast reaches every device. At thousands of phones, that noise becomes the traffic.

A /32 per device. Each device is a subnet of one and the router answers for everyone, so broadcasts stop at the device. The network scales by routing, not by flooding.

Core rack: CRS309 switches carrying the PON Sticks, the CCR2116 gateway and 10G Omada switching.

Managed and serviced by CureComp: every device labelled, every link documented.

Phone-farm racks on site, 20 handsets per 2U chassis.

Photos and figures from the Thine Technology deployment. Network design and operation by CureComp; the platform and its services belong to the client.

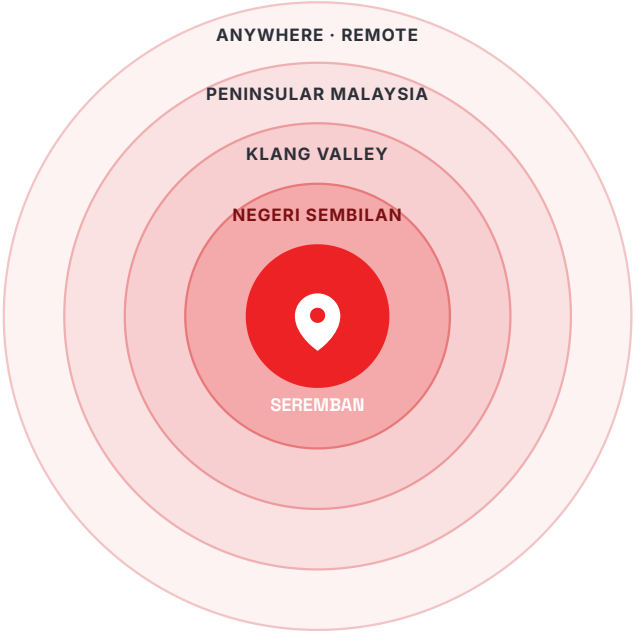

OUR CLIENTS

Trusted by government, industry and healthcare

Government departments, district councils, schools, manufacturers, clinics, hotels and network operators — organisations we have served.

01 Kementerian Dalam Negeri (KDN)	02 Majlis Daerah Kuala Pilah (MDKP)	03 LPPKN Seremban 2	04 Galeri Diraja Tuanku Jaafar Seremban
05 Kolej Vokasional Kuala Klawang	06 BCEI Malaysia Sdn. Bhd.	07 AIRR Labs Malaysia	08 Perfect Network Sdn. Bhd.

Listed as a record of past and present engagements. Individual project details remain confidential.

COVERAGE

Based in Seremban. Reachable from anywhere.

Head office	Seremban Plaza, Seremban — walk-in counter and workshop
On-site	Across Negeri Sembilan and the Klang Valley
Contracted	Wider Peninsular coverage for multi-site clients
Remote	Support with no geographic limit

Recent work has taken us to

Kuala Pilah · Nilai · Kuala Klawang · Cyberjaya · Kelantan · Terengganu

ENGAGEMENT

Straightforward from first call to steady state

Quotes for managed IT, networking and cloud are tailored to your requirement — one conversation is usually all it takes to scope it.

01
Listen
A short call or site visit: what you have, what breaks, and what it costs you when it does.

02
Scope & quote
A written proposal with the hardware, licences, service levels and price. No surprises.

03
Deploy
Staged, tested, cut over out of hours where we can — with the documentation and credentials.

04
Support
Monitoring, patching, spares and a real human on the line, 24/7 on covered contracts.

Engineers answer the phone
24/7 live support on covered contracts means an engineer — not a queue position and a promise to call back tomorrow.

NOC monitoring included
Links, switches, servers and access points watched continuously. We usually know before you do.

Remote first, on-site when it counts
Most issues are fixed remotely; when they can't be, we dispatch from Seremban.

HOW WE OPERATE

The habits behind the work

Say it straight
If a repair isn't economical, we say so. If a spec is overkill, we say that too. Quotes are written down before work starts.

Document everything
Diagrams, configurations and credentials belong to you. No system we touch should be a mystery to the next person.

Answer the phone
A real engineer on the line on covered contracts — at any hour, without a script.

Prefer open standards
Standards-based networking and supported open firmware where it makes sense — so you're never trapped by one vendor.

Design for the bad day
Backups, spares and failover are decided while everything is working — the only time you can think clearly about them.

Stay local
Seremban is home. Being nearby means we can be on-site when remote support genuinely isn't enough.

Your documentation is yours. Network diagrams, configurations, asset lists and credentials are handed over — we don't hold clients hostage with undocumented systems.

No lock-in

LET'S TALK

Tell us what's broken, or what you're building.

A parts list, a photo of the error, a floor plan or just "it won't turn on" — all of it works. For managed IT and cloud we scope your requirement first; that's how you get a price that holds.
